NEXUS

Service clusters

Group services and inspect the shared routing paths used by a cluster.

Where to go: /nexus?workspace=clusters

Access and authority

Cluster access; create/edit/delete require Admin.

01 / Explore a cluster

Before you begin: Know the affected service group.

1. Open Fabric Preview

Select the cluster and inspect entry points, service mesh, membership, routing readiness and ownership.

2. Follow the route

Trace the service path and inspect missing diagnostics or other route indicators. Open the relevant service to verify runtime evidence.

How to confirm success

You understand which services and routes form the cluster.

Stop and check

A drawn connection describes configuration; it is not proof that traffic is currently flowing.

02 / Maintain cluster membership and routes

Before you begin: Have the approved service grouping and endpoint contracts.

1. Open Configuration

Create or edit the cluster identity, owner, environment and service/entry membership.

2. Set routing and save

Review extraction, formatting, shipping, diagnostics and restart routing fields offered by the editor. Save and revisit Fabric Preview for missing routes. Delete only retired clusters after confirmation.

How to confirm success

The preview matches the saved membership and intended routes.

Stop and check

Do not change a shared route without checking all member services that depend on it.

Something is blocking you?

Missing route

Have the owner supply the approved endpoint; do not substitute an unrelated working URL.

Terms in plain language

Entry point

A service at the beginning of the cluster's path.
