NEXUS

Business flows

Describe a business journey so incident impact follows the user's actual service path.

Where to go: /nexus?workspace=flows

Access and authority

Business flows access; create/edit/delete require Admin.

01 / Follow a business journey

Before you begin: Know the business outcome and participating services.

1. Open the flow

Select the journey and inspect ordered service steps, entry/outcome and current evidence correlation.

2. Read impact in context

Check required versus optional steps and the affected path. Open linked incidents/services for evidence rather than interpreting all catalog dependencies as impacted.

How to confirm success

You can explain which step prevents the business outcome.

Stop and check

An optional service failure may not stop the whole journey; verify the flow's declared rules.

02 / Create or maintain a flow

Before you begin: Have the process owner's approved step sequence.

1. Configure the journey

Create/edit name, ownership and ordered service steps. Set required/optional behavior and the fields the editor requires.

2. Save and inspect

Review the rendered journey after saving. Remove obsolete flows only after confirming that incident correlation no longer needs them.

How to confirm success

The visual journey reflects the approved sequence and scope.

Stop and check

Incorrect flow membership can mislead business-impact calculations.

Something is blocking you?

Unexpected impact

Inspect the flow's service order and required flags before accepting the inferred impact.

Terms in plain language

Required step

A step necessary for the declared business outcome.
