REPORTING

Hovering queue

Monitor loan-ledger movement, repair eligible stale dates and recover reviewed failures.

Where to go: /reports?workspace=hovering

Access and authority

Hovering queue access. Operational actions require their configured role; midnight policy is Admin-only.

01 / Investigate queue movement

Before you begin: Know the debit account/reference or affected period.

1. Read the operating state

Open Hovering queue > Queue command. Read source connection, bot operating window, backlog, movement and last-read context. A paused window and a source failure are different.

2. Scope and inspect

Search debit account/reference; filter status and created-from/before times. Open a row in the right drawer to read amount, reference, installment date, failure description and source identifiers.

How to confirm success

The investigation names the specific record/state and current source evidence.

Stop and check

A throughput estimate needs sufficient observations; no measured rate is not proof of a stopped bot.

02 / Carry stale installments into today

Before you begin: Confirm the record is Pending with an installment date before the current source date.

1. Choose exact or whole eligible scope

For one record, use its date-repair control in the drawer. The sidebar bulk command acts on the eligible overdue scope, not merely the rows on the current page; review its confirmation.

2. Repair and verify

Accept only the intended scope. Read the updated count and refresh records/custody. Date repair changes eligible stale installment dates; it does not authorize a debit or guarantee bot processing.

How to confirm success

The affected records show the current date and a custody entry.

Stop and check

Already-current dates need no change. Do not use date repair as a substitute for resolving a failure.

03 / Requeue failed records

Before you begin: Resolve the reported cause and have authority to retry processing.

1. Select failures

Choose Failed, narrow the reason and filters, then Review selected or Review all filtered failures. Read the exact preview; all filtered can span pages.

2. Review and confirm

Check identities, amounts and explanations. Reviews expire after ten minutes; changed records require a new review. Confirm requeue once only if the cause was addressed.

3. Check the outcome

Read the updated count and Pending state. The bot may process the records again; use custody history to trace the action before any repeat.

How to confirm success

Only reviewed eligible failures return to Pending with recorded evidence.

Stop and check

Requeue is not proof of successful financial processing. If the response is uncertain, inspect custody and source state first.

04 / Manage midnight repair and custody

Before you begin: Admin authority is required to change the automatic date-repair policy.

1. Inspect the policy

Read the current midnight repair state and date boundary. Toggle only under the approved operating decision.

2. Confirm the audit

Review Custody marks. Browse full custody history, page through results, and collapse it to return to recent marks. Check actor, timestamp, count and reference.

How to confirm success

The saved policy and subsequent repairs are attributable.

Stop and check

Enabling automation permits future eligible repairs; it is not an immediate proof that today's queue was repaired.

Something is blocking you?

Failed review expired or record changed

Refresh and create a new preview; never reuse stale scope.

Unexpected date

Check source timezone and installment date with the owner; browser display time may differ.

Terms in plain language

Pending

Waiting for further processing.

Custody

Attributable evidence of the operator/system change.
