TRUSTLINK

Daily extraction pipeline

Follow the daily IDC/DigiPay extraction through validation and file readiness.

Where to go: /trustlink?tab=pipeline

Access and authority

Daily extraction access; triggering runs and changing sources have separate permissions.

01 / Check today's extraction

Before you begin: Know the required business date and enabled sources.

1. Read the run identity

Open Trustlink and Pipeline. Check date, status, selected run and source route. Confirm whether today's export already exists.

2. Follow each stage

Read IDC Ingest, DigiPay Ingest, Transformation, Validation, File Save and Download. Inspect failed/skipped stages and row counts; an intentionally disabled source is not a successful ingestion.

3. Download the ready file

Use Download Export only when the file is present. Confirm the filename/date and record counts before onward delivery through your approved process.

How to confirm success

You can show which inputs ran and which export is ready.

Stop and check

A completed extraction or local download is not proof that an external recipient received the file.

Something is blocking you?

Run failed or file absent

Inspect the failing stage and history. Ask an authorized operator to recover the run rather than repeatedly triggering new runs.

Terms in plain language

Pipeline

The ordered stages that turn source data into an export.
