TRUSTLINK

Manual extraction and overwrite

Start a controlled extraction or replace today's export when justified.

Where to go: /trustlink?tab=pipeline

Access and authority

Manual extraction access plus the operation's role restrictions.

01 / Run an extraction

Before you begin: Verify today's state and that source configuration is correct.

1. Inspect before triggering

Check whether a run is active or today's export already exists. If ready, download it instead of creating a duplicate.

2. Run and follow

Choose Run Extraction (or Trigger First Run). Wait for scheduling, then follow Pipeline through completion and file readiness.

How to confirm success

The new run has a terminal status and a verified artifact.

Stop and check

A scheduling response means accepted, not completed.

02 / Overwrite today's export

Before you begin: Have a valid reason and approval to replace the existing output.

1. Review what will change

Inspect today's existing export and affected delivery process. Choose the overwrite action and read its warning.

2. Confirm deliberately

Accept only if replacement is intended. Follow the resulting run and verify the new file/date/counts before distributing it.

How to confirm success

The replacement export is checked and the run history explains the operation.

Stop and check

Do not overwrite simply to troubleshoot a download or while another operator is distributing the previous artifact.

Something is blocking you?

Already exists

Download the current export, or use the explicit overwrite workflow if a replacement is authorized.
